TITLE: Characteristics of some artificial substrata for use in closed ecological systems

SOURCE: AN SSSR. Otdeleniye biologicheskikh nauk. Problemy* kosmicheskoy biologii, v. 3, 1964, 198-203

TOPIC TAGS: closed ecological system, life support, hydroponics, tomato, beet, carrot, manned space flight

ABSTRACT: Four artificial substances, vermiculite, penoshamote, ceramsite, and perlite, have been tested for their potential use as substrata for hydroponic growing of plants in spaceships. These substances are well known modern structural materials and possess high porosity and low specific weight. Their light weight and porosity enable these substances to hold a large amount of moisture, making them highly desirable as substrata. In order to evaluate the biological properties of these substrata, cabbages, beets, carrots, and tomatoes were grown hydroponically from seed on them from May to September 1962. Of the substances thus tested as substrata, vermiculite gave the best results. Plants grown on vermiculite

produced leaves, roots, stems and fruit whose weight was two to three times that of plants grown on other substrata. Since it is intended to use these substrata for growing higher plants in closed ecological systems for prolonged space flights, further research into the biological and chemical properties of artificial substrata is recommended.

TITLE: Experimental investigation of the higher plant in a closed ecological system [Paper presented at the Conference on Problems of Space Medicine held in Moscow from 24 to 27 May 1966]

SOURCE: Konferentsiya po problemam kosmicheskoy meditsiny, 1966. Problemy kosmicheskoy meditsiny. (Problems of space medicine); materialy konferentsii, Moscow, 1966, 145-146

TOPIC TAGS: life support system, closed ecological system, plant ecology, space nutrition

ABSTRACT: Calculations have been made for one of the variants of a higher-plant link for a closed ecological system. The input and output of the link are determined in respect to the basic elements. Experiments confirmed that it was possible to obtain a crop of the selected plants which exceeds the designed productivity of a given enclosure.

A conveyor system for continuously overlapping crops of the selected plants was worked out and tested experimentally. This makes it possible to have a continuous output of edible biomass in accordance with a set schedule. It was demonstrated experimentally that a continuous harvesting of the crop was possible without changing the area of the assimilating

Card 1/2

ACC NR: AT6036547

surface of the plants substantially, thus assuring continuous air regeneration.

Further experiments determined the optimum light requirements for certain selected plant cultures. Gas exchange characteristics (CO_2 and O_2) for various parts of the day and various ages of the plants were worked out for a series of selected cultures. Optimal concentrations of CO_2 in relation to various light intensities were determined.

The proper nutrient solutions for replacing chemicals used up by the plants were theoretically calculated and experimentally confirmed for a whole series of cultures. The experimental testing and determination of a series of characteristics of this model plant link simplifies the insertion of this higher-plant link into the entire closed ecological system. [W.A. TOPIC TAGS: life support system, closed ecological system, plant physiology, aerponics, space nutrition, space food

ABSTRACT:
In developing a higher-plant link for a closed ecological system, the main requirement is the assurance of a constant supply of vegetable food, oxygen, and water to man. This problem can be solved by the creation of a conveyor system of growing plants of different ages.

Depending on the cultivation method adopted (aerponics or hydroponics), the conveyor system is based on the principle of movable nests for fixing the plants or on a stationary planting without changing the distance between plants while they grow. In the first system (aerponics) an

Card 1/2

ACC NR: AT6036611

illuminated seeding area is used more effectively than in the second system (hydroponics).

Experiments with the conveyor system using hydroponics have indicated that it is possible to obtain a continuous supply of fresh vegetables in amounts required by daily rations, that the nutritional value of vegetables obtained in a conveyor system corresponds to requirements as far as vitamin content is concerned, and that it is possible to greatly increase the productivity of plants in a conveyor system by regulating the basic parameters of the ecological complex (temperature, humidity, illumination, and root and aerial feeding).

TITLE: Instability of spin waves in ferrites in the presence of domain structure

SOURCE: Fizika tverdogo tela, v. 8, no. 11, 1966, 3204-3207

TO TC TAGS: spin wave, ferrite, magnetic domain structure

ABSTRACT: The effect of domain structure on the conditions of parametric excitation of spin waves was studied in polycrystalline samples of MgMn- and MgCr-ferrites and MgMn-ferrite single crystals. The instability threshold of spin waves was studied in the range of constant fields in the presence of which the domain structure exists. It is shown that the nature of the dependence of the threshold field h_{thr} on the constant field H in the range of fields insufficient for saturation is determined by the magnitude of the magnetization and the frequency of the exciting field. It is postulated that in the range of weak fields, the course of the dependence of h_{thr} on H is determined by the proximity of the frequency of the exciting field to the frequency of natural ferromagnetic resonance, and in the range of existence of lamellar domain structure, it is determined by the change in the orientation of the magnetization vector as H changes due to rotational processes. In conclusion, authors are deeply grate-

ABSTRACT:

The plants chosen from the more than 2500 domesticated species of higher plants on Earth for air, water, and food regeneration in closed ecosystems should meet the following specifications: 1) should yield maximum food value; 2) should produce no metabolites deleterious to man or other plants; 3) should flourish in an environment suited to man; 4) should be familiar to man. Various models of possible sets of

Card 1/3

ACC NR: AT7011647

higher plants for closed ecosystems were studied and their input-output parameters determined. An example of such a set, familiar to Russians, is: potatoes, white cabbage, carrots, beets, tomatoes, radishes, and Chinese cabbage. An "acreage" of 15-16 m² using these plants should yield about 1500 g of edible vegetables per day and provide 60% of the daily carbohydrate and 100% of the daily mineral requirement for one man. This many plants would also provide about 90% of the daily oxygen requirement. This diet could be supplemented with synthetic or preserved foods (animal proteins and fats). Supplementary oxygen could come from storage or from a small chlorella cultivator. In experimental trials, this set of plants was hydroponically cultivated and exceeded the calculated yield: cabbage yielded 22--24 kg/m²; carrots 30 kg/m²; tomatoes, 25 kg/m²; radish, 10--12 kg/m²; and Chinese cabbage, 22--24 kg/m². Potatoes were the least efficient, yielding only 5--6 kg/m². A continuous cultivation system, containing plants of all ages and based on types affording frequent harvest and continued growth, ensures a constant area under cultivation and a steady yield of food, water, and O₂; eliminates the need for food storage; and greatly increases the efficiency of cultivation and

Card 2/3

ACC NR: AT7011647

illumination. A conveyor cultivator was built and tested. With a cultivation area of 5 m^2 , it yielded 1 kg of edible foodstuff, over 10 liters of distilled water, and almost 150 liters of O_2 per day for 100 days. Diurnal and life cycles of photosynthesis and respiration intensity with illumination of various wavelengths and intensities from 50 to 2000 w/m^2 were determined for various atmospheres ($\text{pCO}_2 = 0.03$ to 1.5%; $\text{pO}_2 = 14$ to 48%), and optimum atmospheric parameters were established. These studies have furnished basic data for designing automatic control systems for the higher plant link in closed ecosystems. [ATD PRESS: 5098-F]

TITLE: Parametric excitation of spin waves in polycrystalline specimens of MgMn ferrites

SOURCE: Fizika tverdogo tela, v. 7, no. 11, 1965, 3320-3325

TOPIC TAGS: ferrite, polycrystal, spin wave, magnetic field

ABSTRACT: The authors study polycrystalline ferrites with regard to the effect of their structural and magnetic characteristics on the instability of spin waves. The method of parallel pumping was used for determining the relationship between the SHF threshold field and the steady magnetic field in studying parametric excitation of spin waves in specimens with various percent contents of MgO, MnO and Fe₂O₃. A number of specimens were studied with wide variations in grain size, magnetization and ΔH. The measurements show that the threshold fields and spin-wave losses are

Card 1/2

090 2-38

L 6419-66
ACC NR: AP5027410

independent of the structure of the polycrystal in specimens with close to stoichiometric composition in steady fields where the specimen can be magnetized to saturation. It is assumed that this is because the excited spin waves are shorter than the crystallite dimensions. Measurements in fields too low for saturation show that the domain structure in specimens with high magnetization causes a considerable reduction in the threshold fields. In conclusion, the authors thank A. A. Shilova for participation in the experiment, and also I. I. Sil'vestrovich and L. A. Rödnova for furnishing the specimens and data on their microstructure and static characteristics.

AUTHOR:

Lebedeva, Yu. I., Chief

TITLE:

Central Laboratory of the Yaroslavl' State Works SK
Zavodskaya laboratoriya, 1960, Vol. 26, No. 10,
pp. 1188 - 1189

PERIODICAL:

TEXT: The author reports on a great extension of subjects of scientific research work at the Central Laboratory of the Yaroslavskiy gosudarstvennyy zavod SK (Yaroslavl' State Works of Synthetic Rubber). The following fields of work are mentioned: 1) Improvement of divinyl synthesis from alcohol (method by S. V. Lebedev, Academician). The results of this improvement were introduced at the author's works, and made it possible to save 10 million rubles a year. 2) Increase in quality of copolymeric rubber- and latex types. Conditions for the production of soft rubbers were determined at the author's laboratory. These rubbers render mechanical plastification superfluous, and improve the properties of divinyl nitrile rubbers. The author's laboratory cooperates with special institutes of the synthetic rubber industry which are studying the

Card 1/3

Central Laboratory of the Yaroslavl' State Works SK S/032/60/026/010/034/035
B016/B054

synthesis of new rubbers; these rubbers are said to have better properties than natural rubber. Copolymers of divinyl with acrylic acid nitrile, with methyl-vinyl pyridine, and other substances were synthesized in the author's laboratory. These copolymers have specific properties, and are now being tested by special institutes. Further, the author mentions the experimental apparatus available in her laboratory. An apparatus for the acoustic analysis of the oxygen content in nitrogen for any concentration range was installed and put into operation in cooperation with the Yaroslavskiy tekhnologicheskiy institut (Yaroslavl' Institute of Technology). It delivers results within 1-1.5 min. Besides, the chromatographic method of determining the composition of monomers, the spectrometric method of determining the micro-structure of polymers, and the photoelectrocolorimetric method of determining the concentration of iron and Nekal, are being applied in the Central Laboratory. The staff of the Central Laboratory was nearly doubled. The author mentions the following difficulties: Some experimental apparatus of semioperational type, equipment, reagents, heat-proof vessels are lacking; laboratory furniture is hard to procure. She suggests to adapt the salaries and allowances of laboratory staff to

Card 2/3

Central Laboratory of the Yaroslavl' State Works SK S/032/60/026/010/034/035

2387. LEBEDEVA Z. A. Inst. Nat. de Tuberc., Moscou. *Quelques symptômes extra-pulmonaires de la primo-infection tuberculeuse. Some extra-pulmonary symptoms of primary tb infection REV. TUBERC. (Paris) 1956, 20/7-8 (828-842) Illus. 10

In the course of a primary tb infection, modifications of the osseous tissues may occur without the development of clinically or radiologically perceptible lesions of the lungs or of the intrapulmonary lymph nodes. These skeletal alterations may be of focal or of dystrophic nature. The topography of the focal lesions during this period resembles that in typical osteo-articular tb. The development of the focal bone lesions differs with the resistance and the age of the patient and with the localization of the disease. Radiological examination of the skeleton is one of the main diagnostic aids. The focal lesions of the bone marrow may present the same morphological aspects as the focal lesions in the pulmonary parenchyma and the hilar lymph nodes, which may develop simultaneously. Early treatment may prevent the disease from developing into clinically characteristic osseous tb.

Biochemistry of experimental gastritis in light of corticovisceral connections. V. M. Vasyutochkin, A. V. Drobintseva, O. N. Gurovskova, Z. N. Lebedeva, and O. A. Goryacheva. *Fiziol. Zhur. S.S.R.* 42, 192-202 (1966).—Exptl. gastritis in cats lowers the reducing and oxidizing ability of the mucous membranes of the stomach (tests with decolorization of methylene blue and with formation of indophenol blue); acid phosphatase also declines as do free and bound vitamin B₁ and nicotinic acid. In normal animals carbocholine enhances the anoxidative link in cell respiration of the gastric lining, while adrenaline or sympathol has no effect. Block of parasympathetic innervation with atropine represses cellular respiration (mainly the aerobic part), while sympatholitin, which blocks the sympathetic innervation, causes an increase in the aerobic respiration. Both of these drugs repress considerably the biochem. shifts listed above in exptl. gastritis. Group B vitamins greatly increase the volume and acidity of gastric juice, and restore the oxidation-reduction reactions of gastric lining. G. M. Kosolapoff

TITLE: Electrical reactions of the inferior colliculus of rats to brief sounds (clicks) 12

SOURCE: Byulleten' eksperimental'noy biologii i meditsiny, v. 61, no. 2, 1966, 3-6

TOPIC TAGS: electrophysiology, rat, acoustic biologic effect, audition

ABSTRACT: The electrical reactions of the inferior colliculus of rats are similar to those of cats. Typically, they start with a rapid positive wave followed by a slow negative deviation. In some cases two positive waves with a subsequent negative deviation were recorded. The amplitude of the reactions in the 30 anesthetized white rats studied ranged from 70-400 microvolts. The maximum amplitude was noted in the experiments in which the electrode was in the center of the nucleus. The thresholds of the reactions were somewhat higher than the audibility thresholds of man under the same conditions.

The average threshold in the rats with normal middle ear was somewhat higher than that in cats (the difference was no more than 5 db). The average length of the latent period of the reaction to the clicks was 3.1 milliseconds with the intensity of the stimulus 45-50 db above the threshold. When the intonsity of the signal was changed 5-80 db above the threshold,

L 31187-66

ACC NR: AP6022564

the latent period decreased from 5 to 2.8 milliseconds. The duration of the positive wave of the response had different values -- from 2.4 milliseconds.

The amplitude of responses caused by a second signal presented at intervals of 3-100 milliseconds from the first was 50% of the amplitude of the first response at a 3-4.6 milliseconds interval. Complete restoration of the amplitude of both responses usually required 60-70 milliseconds. This paper was presented by Academician V. N. Chernigovskiy on 1 August 1964. Orig. art. has: 3 figures. TITLE: Investigation of new types of thermocouples for measuring tempera-
tures up to 1,800°C

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 11, 1961, 12, abstract 11B71
("Tr. in-tov Kom-ta standartov, mer i izmerit. priborov pri Sov.
Min. SSSR", 1960, no. 42 (102), 29 - 38)

TEXT: An investigation was carried out upon thermocouples from alloys of
Pt and Rh, containing 1, 6, 10, 13, 20, 30, and 40 % Rh. The influence of the
refractory materials used for reinforcing the thermocouples was clarified. The
least influence upon the thermoelectric characteristics of Pt-Rh alloys was
exerted by oxides of Th, Be, and Al. Zr oxide has a strong influence. As the
diameter of thermoelectrodes increases, the influence of the material is reduced.
The influence of the refractory ceramic at high temperatures is reduced as the
Rh content in the alloy is raised. The greatest stability is demonstrated by

thermocouples of ПР 30/6 (PR 30/6). Under repeated measurements of the temperature of liquid steel by means of them, and without renewing the working junction, their characteristic showed almost no change. The thermocouples ПР 100/20 (PR 100/20) were withdrawn from testing because of their excessive fragility, even though their readings remained practically constant.

TEXT:

Investigations are described of thermocouples made of platinum-rhodium alloys of various percentage composition of the two elements. Thermoelectrical uniformity of the alloys was determined using a special arrangement consisting of an oven, an interlacing device and a potentiometer. The presented tables include results of testing and calibration data for thermocouples of the

following types: MP 13/1 (PR 13/1), MP 30/6 (PR 30/6), MP 30/13 (PR 30/13) and MP 40/20 (PR 40/20). Thermocouples MP 10/0 (PR 10/0), MP 30/6 (PR 30/6) and MP 100/20 (PR 100/20) were tested for long-time stability of the thermo-emf. Recommendations for industrial use of the thermocouples are given. 5 figures. 4 tables. [Abstracter's note: Complete translation]

32.3.229. "Tr. in-tov Kom-ta standartov, mer i izmerit. priborov, pri Sov. Min. SSSR".
1960, no. 42 (102), 29-38

TEXT: The authors studied thermocouples, both electrodes of which were made of platinum-rhodium alloys of varying composition. Sverdlov sovnarkhoz (district economic council) produced platinum-rhodium wires with different rhodium contents, 0.3, 0.5, 0.8 and 1.0 mm in diameter and studied their thermoelectric uniformity. The latter was determined on a semi-automatic industrial set-up consisting of an oven for heating the junction of the investigated wire with a comparison electrode, a rewinding unit and a laboratory potentiometer. The degree of uniformity of the thermoelectric material was determined by the value of the thermoelectric emf created at the junction of the investigated wire with a comparison electrode. The comparison electrode was formed by a piece of wire cut from an end of the investigated bundle. The oven of the set-up was built

of porcelain tube 15 mm diameter and 90 mm long, a platinum heater, thermal insulation, an outer mantle and a stand. The temperature inside the cavity of the oven was determined by means of a Pt-Rh thermocouple. The Sverdlov branch of ВНИИМ (VNIIM) collected and analyzed the data in order to establish deviation limits from the average calibration for the thermoelectric emf of the couples. VNIIM developed a method of calibration of thermocouples, studied their calibration characteristics and analyzed the variation of these properties for thermocouples stemming from different melts. The influence of the contact between the thermoelectrodes and the supporting ceramic of different composition under high temperature conditions and the stability of the thermocouples under various operating conditions were studied. As a result of these comprehensive studies it is concluded that the thermocouples of the ПР 30/6 (PR 30/6) type are the most accurate for measurement of temperatures of molten metals and of temperatures above 1400°C for several hundred hours. For operation under actual working conditions the fixtures and the protective caps should be made of aluminum oxide with titanium oxide added. There are 5 figures, 4 tables and 6 references.
